

Creating an iCloud app-specific password

Last Modified on Sep 27, 2019

Apple requires iCloud Users to use app-specific passwords for all third-party applications such as OnceHub. An app-specific password is a single-use password for your Apple ID that lets OnceHub securely access the information you store in your iCloud Calendar. This access method requires that you turn on [Apple two-factor authentication](#) or [Apple two-step verification](#).

In this article, you'll learn how to create an Apple app-specific password.

Creating an app-specific password

1. Sign in to your [Apple ID account page](#).
2. Click **Settings**.
3. Under **Apple ID**, click **Manage** (Figure 1).

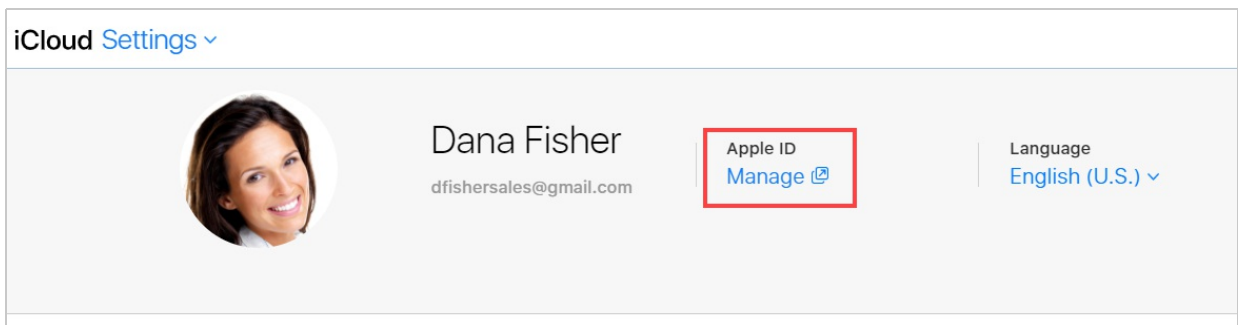

Figure 1: Manage Apple ID

4. In the **Security** section, turn on [Apple two-factor authentication](#) if it is not on already. On older devices, use [Apple two-step verification](#) instead.
5. Under **App-Specific Passwords**, click **Generate Password** (Figure 2).

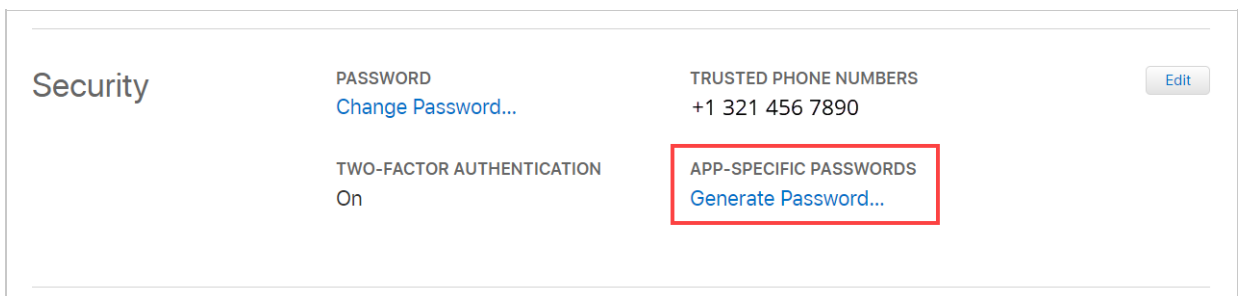

Figure 2: Generate an app-specific password

6. Enter a password label (for example, "OnceHub").
7. Click **Create**.
8. Once the app-specific password is generated, copy it.

You can now use your new app-specific password to [connect OnceHub to your iCloud Calendar](#).

 **Note:**

App-specific passwords are valid until you change your primary Apple ID password. Once you do, all your existing app-specific passwords are automatically revoked and must be generated again. Your OnceHub Account must be reconnected with a new app-specific password.
