

## Apr 16 2026: Streamlined API Key Management and Configure Webhooks via the OnceHub Interface

### Streamlined API Key Management

We have upgraded our API settings to provide enterprise-grade security and greater flexibility. You can now:

- Create and maintain up to 25 API keys simultaneously to handle different vendors, staging environments, and production apps independently.
- Benefit from enhanced security, as we now use one-way hashing to ensure keys are never stored on our servers. As a result, keys are **displayed only once** upon generation. Ensure to save it securely at that time.
- Delete specific keys instantly if they are compromised or no longer needed, without affecting your other active integrations.

**NOTE:** Your existing API key (created prior to this update) is now labeled as **General API Key**. It will continue to function normally, so no changes are required for your existing integrations, current API call methods and headers remain exactly the same.

To learn more, read our [API Key Security & Management](#) article.

### Configure Webhooks via the OnceHub Interface

We have made it easier to configure and manage your webhooks directly from the OnceHub interface instead of complex API configurations.

Administrators can now configure real-time event triggers, such as new bookings, cancellations or chat activity directly from the OnceHub interface without touching the API.

Setting up a webhook is now as easy as:

- **Connecting:** Enter your destination URL.
- **Choosing:** Select your specific event triggers.
- **Securing:** OnceHub generates a unique secret key to protect your data.

This setup ensures your external apps stay in sync automatically, eliminating the need for your system to constantly check OnceHub for new data.

To learn more, read our [Creating And Managing Webhooks via OnceHub](#) article.
